

CHEMCLAD Provides Outstanding Chemical Resistance

After a routine tank inspection this customer was informed the tank had approximately 2 years left in its current condition. The customer asked a local blast/coating company if they had something that could be applied to extend the life of the tank.

ENECON's CHEMCLAD SC was recommended. The customer quickly issued a purchase order to have the tank coated. At that time the blast/coating company owner and crew were out of town, on location.

The only person left at the company was a new employee, all of nineteen years old. He was up to the task and asked to put the broom down and spray the tank. The tank was blasted and then the owner of the ENECON Distributorship in Alberta, using internet and telephones, walked the employee through the process.

Having never used the CHEMCLAD SC before, the employee first read all the technical data sheets, instruction sheets and SDS. Using a scale, he made partial mixes of CHEMCLAD SC and

applied this by using an airless sprayer. The CHEMCLAD SC was applied perfectly. The customer was extremely happy with the results and put the tank into service immediately.

The tank has been moving various liquids and is 4500psi pressure cleaned between loads. It has been performing perfectly after multiple uses.

A nineteen year old novice with no prior training or hands on experience applied CHEMCLAD SC for the first time with zero flaws. That is an amazing feat.

Tank Hauls various:

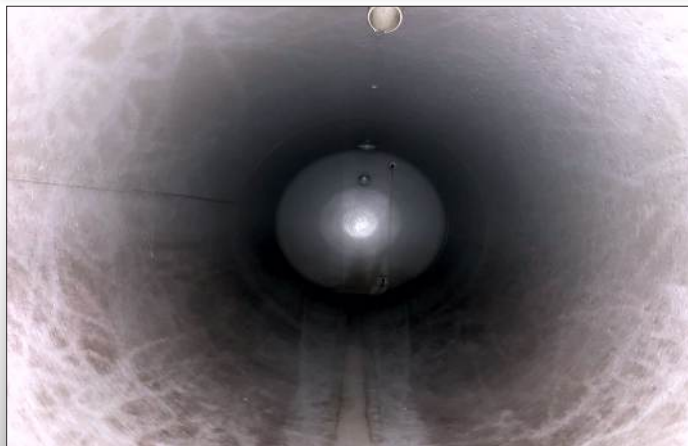

- 15% Acid Content
- Produced water
- Condensate

Product:

- CHEMCLAD SC haze gray
- 20kg kit
- Scale was used to make partial mixes

Timeline:

- 2 days to complete (blast 1- coat 1)
